Introduction

EnCap recognizes the importance of effectively managing cybersecurity threats. The following is a high-level overview of the cybersecurity program.

Governance & Risk Management

Senior Level Engagement

EnCap recognizes that an effective cybersecurity program starts with the “tone at the top” and is committed to senior level leadership of the cybersecurity program.

The Chief Information Officer(CIO) serves in the capacity as Chief Information Security Officer, and in consultation with the Chief Financial Officer (CFO), develops and manages EnCap’s information security and resiliency programs.

On a quarterly basis, the CIO reports on the status of Cybersecurity to the EnCap Partners.

Risk Assessment and Management

EnCap performs regular risk reviews, including vendor risk assessments and reviews the risk with senior level managers. In addition, EnCap conducts an annual gap analysis and roadmap review.

Policies and Procedures

Information security policies are reviewed and approved by the CIO, CFO and Chief Compliance Officer (CCO). All stakeholders sign-off on their receipt and understanding of the policies.

Testing and Monitoring

The cybersecurity program is reviewed annually by ACA Compliance.

Continuously Evaluating and Adapting to Changes

Cybersecurity policies and procedures are reviewed annually, incorporating ongoing program metrics and risk analysis results.

Communication

Cybersecurity program updates are presented on a quarterly basis to the Partners.

Access Rights and Controls

User Access

EnCap maintains role-based access privileges to internal systems and data, assigned on a need-to-know basis with defined separation of duties.

All access within EnCap’s systems require uniquely identifiable assigned accounts to ensure accountability of action.

In the case of outside vendor access, such access is time limited to 30 days with formalized approval by the CIO required. At the end of 30 days, approval must be requested again.

Access Management

EnCap maintains industry standard password policy requirements that are enforced at the information system level. Multi-factor authentication is employed to ensure defense in depth.

Access Monitoring

All access is monitored with violations and exceptions escalated to the security operations center for investigation and resolution.

Office365 based system access is geo-locked to North America.

EnCap reviews all access on a quarterly basis.

Information Management

Security of non-public information

EnCap maintains role-based access privileges to internal systems and data, assigned on a need-to-know basis with defined separation of duties.

EnCap uses the Forcepoint data loss prevention tool suite to manage data and to ensure that no non-public information is disclosed.

All data is classified as internal use only and encrypted by default. Secure data is only shared using secure means and is not transmitted open over open email protocols.

Limitations on Data Retention

EnCap maintains a defined data retention policy and has an archive process in place to move records into secure cold storage on an ongoing basis.

Data Loss Prevention

Vulnerability Scanning

EnCap conducts continuous vulnerability scans using the industry leading Tenable IO management platform. Identified vulnerabilities are evaluated and rectified on an ongoing basis, commensurate with evaluated risk and impact.

Perimeter Security

EnCap maintains current best-in-class firewalls and virtual private networks to maintain perimeter security.

Detection and Response

EnCap uses industry leading managed detection to monitor and act on threats to the network in real-time, as well as using class leading log aggregation and analysis tool sets to continuously monitor and report on potential security indicators for further investigation.

EnCap conducts annual penetration testing of network integrity using an external vendor, reviewing and acting upon findings on a risk and impact evaluated basis.

Patch Management

EnCap has put in place a patch management tool that ensures all critical software and operating system updates are installed as they become available including third-party software patching.

No end-of-life software or operating systems are in operation within EnCap, confirmed with ongoing inventory and vulnerability scans.

Hardware and Software Inventory

EnCap maintains up-to-date hardware and software inventories using automated processes.

Encryption and Network Segmentation

The EnCap internal network is segmented, with safeguards to limit and restrict traffic outside of each segment. Network usage such as voice, data, server, and virtual private network traffic are isolated.

Incident Response and Resiliency

EnCap has developed an up-to-date incident response plan, with periodic table-top exercises conducted with key stakeholders.

EnCap maintains in-force cyber insurance and response capabilities.

Vendor Management

Vendor Management Program

EnCap has implemented policies and ongoing processes regarding vendor management, including procedures for conducting diligence during vendor selection, evaluating vendor relationships into ongoing risk assessment activities, and performing assessments to ensure that vendors meet security requirements using questionnaires based on industry standards.

Training and Awareness

Comprehensive Cybersecurity Training

EnCap performs ongoing cybersecurity training for all employees, implementing mandatory training on a quarterly basis on timely topics including information security. EnCap contracts with ACA Compliance and Scan13 to ensure cybersecurity training is integrated into ongoing compliance training program.

Continuous Validation

Phishing is a significant, ongoing threat. To ensure that phishing training is validated, EnCap conducts phishing simulations all year round to ensure a high level of phishing awareness with employees is maintained.
